Hello

Many thanks for your reply.

You mentioned that one factor is the course academic demand which is reflected in the entry requirements, and as such, the course academic demand, academic difficulty and level of the examination questions are reflected in the entry requirements a given university asks for admission into their courses.

Do you know if this is applicable in countries such as India and China? For example, India has a university called IIT, which is their equivalent of universities like your own- in that it also asks for very high entry grades, like Imperial, and others like Cambridge and Oxford.

I am wondering whether this similar rationale- the course academic demand, academic difficulty and level of the examination questions being reflected in the entry requirements a given university asks for admission- holding true to these countries, too

I hope you could advise me on this. If not, could you kindly pass this query on to someone who perhaps could?

Many thanks

Aryan Thanki

Dear Aryan,

You have asked an interesting question, but this is not one I am able to answer unfortunately. I suspect the academic level and demand of the course is reflected to some degree in the entry requirements at universities in other countries. However, I am not familiar with university education in China and India, for example, and what influences their grade requirements.

You could ask our international team (international@imperial.ac.uk), but it might be best to contact key universities in those countries to ask.

Best wishes,

Simon

I often work late or at weekends, but do not expect a reply outside your normal working hours.
